VARIETY OF IMPLANT-PROSTHETICS COMPONENTS

Everything From A Single Source
WE_ASSUME_THE_RESPONSIBILITY

UP_TO_30-YEAR_WARRANTY_ON_IMPLANT_ABUTMENTS_AND_IMPLANTS

As one of the world’s largest manufacturers, for the production of our implant-prosthetics components we use a high-quality medical titanium alloy (Ti-6Al-4V ELI according to ASTM F136 and ISO 5832-3) and meet the strictest quality criteria (ISO 13485 MDSAP; Medical Device Directive 93/42/EEC; EU Regulation 2017/745 on medical devices). We assume the responsibility for our products granting voluntarily – in addition to the legally prescribed warranty obligation – up to 30 years of warranty on all Zirkonzahn implant abutments used (titanium bases, Multi Unit Abutments, Multi Unit Abutments Angled, Raw-Abutments® as well as the corresponding screws). Within the current Zirkonzahn warranty regulation, we explicitly include also implants from other manufacturers used with Zirkonzahn implant abutments.

Enrico and Julian Steger

The Zirkonzahn warranty regulation can be viewed at www.zirkonzahn.com.
EVERYTHING FROM A SINGLE SOURCE

We never surrender the control of our products to others. All implant components are designed and produced in South Tyrol at our production sites, Zirkonzahn Molaris I and II. Being the sole manufacture owners, we have full control on the complete production. We know our materials and we can ensure they form a perfect match. This is the only way we can take full responsibility for our products and ensure the highest quality.
In Zirkonzahn Molaris I and II we have a versatile pro
CNC machinery with turning, grinding and coating systems.
Here, highly accurate techniques are used to produce
our milling tools, implant abutments (titanium bases,
Raw-Abutments® etc.) and machine parts.

We are experts in our field and it is important that everyone
shares their know-how. This is the only way to reach the
best results.
EVERYTHING UNDER ONE ROOF

Especially when manufacturing implant restorations it is important to optimally adjust components to one another. From the implant planning software, to analogues for acquiring already placed implants, through titanium bases, Multi Unit Abutments or blanks with a pre-milled implant connection, we produce and develop everything on our own. All components are available for all common implant systems and are fully integrated in our Zirkonzahn Software. With the Zirkonzahn Library Download Center, also 3Shape and exocad® users can implement the libraries into their design software.
EVERYTHING FROM A SINGLE SOURCE
All implant prosthetics components are designed and produced at our production sites in South Tyrol.

QUALITY

STRICTEST QUALITY CRITERIA
In the manufacture of our components, we meet the strictest quality criteria (ISO 13485 MDSAP; Medical Device Directive 93/42/EEC; EU Regulation 2017/745 on medical devices).

100%

FULL COMPONENTS INTEGRATION
All components are fully integrated in our Zirkonzahn Software. In addition, with the Zirkonzahn Library Download Center, also 3Shape and exocad® users can implement the libraries into their design software.

24–48 h

FAST DELIVERY TO YOUR LABORATORY
Depending on the country, ordered components will be delivered directly to your laboratory within 24–48 hours.
UP TO 30-YEAR WARRANTY

We provide up to 30 years of warranty on all Zirkonzahn implant abutments used, as well as on implants of other manufacturers used with the Zirkonzahn implant abutments.

MORE THAN 5000 COMPONENTS

Adjusting each component to one another is particularly important especially in case of implant-supported restorations, for this reason we provide a wide range of implant prosthetics components.

WITH THE PRECISION OF 1/10 – 1/100 OF A HAIR

All components are produced according to the high standards we set for our production process. In order to meet our search for precision and perfection, we use the latest manufacturing technologies.

FOR THE MOST COMMON IMPLANT SYSTEMS

Our components are available for more than 140 implant systems and our libraries are constantly expanded.

LABORATORY ANALOGUE

Our laboratory analogues are made of a medical titanium alloy and replicate the exact implant position and connection. In this way, it is possible to check the fitting accuracy of the final restoration with implant abutments directly on the model. To distinguish the different diameters, the analogues are also available pre-coloured.
Healing caps are used during the healing phase to seal the Zirkonzahn Multi Unit Abutments and to define the emergence profile. They can be anodised in different colours or be available already anodised in pink.
ScanAnalogs combine the function of a laboratory analogue with the one of a scanmarker. In contrast to conventional scanmarkers, they are scanned directly on the impression, not on the model. They are screwed into the impression copings and digitised with the Zirkonzahn scanner: the acquired implant position can be now directly transferred into the software without needing a plaster model. Physical models can be then produced from the acquired data (CAD/CAM Model Maker software module). In their role as laboratory analogues, ScanAnalogs replicate the exact implants position and orientation on the model.
SCANMARKER

Thanks to the special geometry of the Scanmarkers and the precision of the Zirkonzahn scanners, it is possible to transfer the exact implants position and orientation from the model into the software.
WHITE SCANMARKER

White Scanmarkers are used during the scan phase to register the implant position and orientation. The white surface of the scanbody is not reflective, therefore they are especially suitable for the application in the patient’s mouth. Thanks to their small geometry, it is even possible to scan implants which are particularly narrow or deeply placed. White Scanmarkers can also be used as Scanmarkers on the plaster model.
WHITE METAL SCANMARKER

White Metal Scanmarkers are used to acquire the implants position and orientation during intraoral or model scans. After appropriate sterilisation, they can be reused several times. White Metal Scanmarkers are particularly resistant, dimensionally stable and visible on x-rays thanks to their plasma coating, which prevents light reflection during scanning (intra- and extra oral) improving scan quality. Regardless of the implant system used, all White Metal Scanmarkers can be screwed in and out with a special screwdriver (Screwdriver WMSM and Impression Coping). The screwdrivers are available in different lengths.
Impression copings are used for the exact transfer of the implant position. This can be transferred to the model in two ways: using laboratory analogues or our ScanAnalogs, creating a digital implant model without preparing a traditional plaster model.
IMPRESSION TAKING WITH OPEN/CLOSED TRAYS AND IMPRESSION COPINGS

OPEN TRAY

CLOSED TRAY
TITANIUM BASES

Unlike restorations that are directly screwed on the implant, the use of titanium bases reduces the effect of transverse forces on the prosthesis. We generally recommend the use of titanium bases for all implant-supported restorations, especially for those in the anterior region.

TITANIUM BASES IN 5 HEIGHTS ...

Except for the Narrow Titanium bases, Zirkonzahn titanium bases are available in up to five different platforms or chimney heights, in order to either bring the implants to the desired gingival level or to adjust them to the tooth length. Due to their reduced geometry, the Narrow Titanium Bases are used in the anterior region.
... GOLD-PLATED AND ANODISED

All Zirkonzahn titanium bases are available with a high quality gold plating. The gold coating increases the biocompatibility and the golden shade reduces the grey value of the entire restoration.

Alternatively, titanium bases can also be anodised in different colours using the Titanium spectral-coluring Anodizer. The high biocompatibility of the material remains unchanged.

Order components in the Zirkonzahn Webshop via the Zirkonzahn Modellier software.

Conical Titanium Bases NON HEX without anti-rotation connection as well as anti-rotation device on the chimney, are ideal for the manufacturing of bridges and multi-unit restorations. The titanium bases are designed as short and conical as possible. The spiral grooves on the surface increase the contact area and ensure optimal cement adhesion.

For multi-unit restorations

Conical chimney with spiral grooves

Also available gold-plated for increased biocompatibility and reduced grey values

Without anti-rotation connection as well as anti-rotation device on the chimney

Available in different gingival heights
PARALLEL TITANIUM BASE HEX

Depending on the implant system, Parallel Titanium Bases HEX are equipped with the required anti-rotation connection as well as anti-rotation device on the chimney. This ensures that restorations can no longer be twisted once they are cemented. They are suitable for single crowns.

- For single crowns
- Parallel chimney
- Also available gold-plated for increased biocompatibility and reduced grey values
- With anti-rotation connection as well as anti-rotation device on the chimney
- Available in different gingival heights
NARROW TITANIUM BASE NON HEX

Thanks to their reduced geometry, Narrow Titanium Bases NON HEX without anti-rotation connection as well as anti-rotation device on the chimney, are perfectly suitable for multi-unit restorations on implants placed very closely. The spiral grooves on the surface increase the contact area and ensure optimal cement adhesion.
NARROW TITANIUM BASE HEX

Depending on the implant system, Narrow Titanium Bases HEX are equipped with the required anti-rotation connection as well as anti-rotation device on the chimney. This ensures that restorations can no longer be twisted once they are cemented. Thanks to their reduced geometry, they are suitable for single crowns closely placed in the anterior region.

For single crowns

Parallel chimney

Also available gold-plated for increased biocompatibility and reduced grey values

With anti-rotation connection as well as anti-rotation device on the chimney
NARROW TITANIUM BASE

Narrow Titanium Bases are especially advantageous for implants on bone level, since their platform diameter is minimised. This helps to prevent bone atrophy. Thanks to their reduced platform height, their metal structure is invisible under the restoration, even in case of very low gingival level or gingival atrophy. They are suitable for closely placed implants in the anterior region.
The Titanium Bases NON HEX K80 Angled Screw Channel without anti-rotation connection, but with the anti-rotation device on the chimney, are ideal for the manufacturing of bridges and multi-unit restorations. These titanium bases are provided with cut-off marks, which are useful to adjust the height and, at the same time, increase the contact area, ensuring optimal cement adhesion.

For multi-unit restorations

Without anti-rotation connection, but with anti-rotation device as well as cut-off marks on the chimney for adjusting the height

Also available gold-plated for increased biocompatibility and reduced grey values

The side opening permits the tilting of the screw access channel from 0° to 30°

Chimney height can be adjusted to tooth length
Depending on the implant system, Titanium Bases HEX K80 ASC are equipped with the required anti-rotation connection as well as anti-rotation device on the chimney. This ensures that restorations can no longer be twisted once they are cemented. They are suitable for single crowns. These titanium bases are provided with cut-off marks, which are useful to adjust the height and, at the same time, increase the contact area, ensuring optimal cement adhesion.

For single crowns

With anti-rotation connection as well as cut-off marks on the chimney for adjusting the height

Also available gold-plated for increased biocompatibility and reduced grey values

The side opening permits the tilting of the screw access channel from 0° to 30°

Chimney height can be adjusted to tooth length
Titanium Bases K80 Angled Screw Channel combine two advantages in one product. On the one hand, the adjustable chimney height ensures optimal stability and force distribution. On the other hand, the screw channel can be tilted up to 30° to compensate for non-optimal implant positions. The height of the titanium base can be individually adapted to the each restoration. Depending on the intended use, the titanium bases are available with or without anti-rotation device.
The tilted screw channel of the titanium bases K80 ASC prevents the vestibular protrusion of the screw channels, without compromising the full-arch aesthetics.

Conical Titanium Bases NON HEX

Titanium Base NON HEX K80 Angled Screw Channel (ASC)
CONICAL TITANIUM BASE NON HEX K85

The Conical Titanium Bases NON HEX K85 without anti-rotation connection as well as anti-rotation device on the chimney, are ideal for the production of bridges and multi-unit restorations. The spiral grooves on the surface increase the contact area and ensure an optimal cement adhesion.

For multi-unit restorations

Conical chimney with spiral grooves

Also available gold-plated for increased biocompatibility and reduced grey values

Without anti-rotation connection as well as anti-rotation device on the chimney

Chimney height can be adjusted to tooth length
PARALLEL TITANIUM BASE HEX K85

Depending on the implant system, Parallel Titanium Bases HEX K85 are equipped with the required anti-rotation connection as well as anti-rotation device on the chimney. This ensures that restorations can no longer be twisted once they are cemented. They are suitable for single crowns.

For single crowns

Parallel chimney

Also available gold-plated for increased biocompatibility and reduced grey values

With anti-rotation connection as well as anti-rotation device on the chimney

Chimney height can be adjusted to tooth length
TITANIUM BASE K85

The titanium bases K85 can be individually adapted to the restoration thanks to their adjustable chimney height. This ensures optimal force distribution and stabilises the whole structure. Depending on the intended use, the titanium bases are available with or without anti-rotation device.
Read the instructions
ABUTMENT SCREW METAL

This abutment screw is suitable to fix titanium bases, Scanmarkers and Raw-Abutments®, but not for zirconia structures.

For titanium bases, Scanmarkers and metal structures with direct connection, not for zirconia abutments

With conical or flat screw head

Available gold-plated for increased biocompatibility; gold-plating prevents cold welding as well as the unintended loosening of the screw

Abutment Screw Black: screw for fixing the final restoration in the mouth with increased resistance and special coating

Abutment Screw Laboratory: temporary screw for fixing the structure on the model
ABUTMENT SCREW ZIRCONIA

This abutment screw with flat screw head is ideal for fixing directly screwed zirconia or resin structures. However, we generally recommend the use of titanium bases for all implant-supported restorations.

For individual abutments made of zirconia and resin

With flat screw head

Available gold-plated for increased biocompatibility; gold-plating prevents cold welding as well as the unintended loosening of the screw

Abutment Screw Black: screw for fixing the final restoration in the mouth with increased resistance and special coating

Abutment Screw Laboratory: temporary screw for fixing the structure on the model
APPLICATION

Titanium bases, Raw-Abutments® and Scanmarkers can be fixed to the implant using the Abutment Screw Metal. On monolithic zirconia abutments, screws with flat seat must be used, in order to avoid tensions in the zirconia which, in the worst case, can lead to cracks in the abutment.

ABUTMENT SCREW METAL

The screw seat can be conical or flat, depending on the implant system.

ABUTMENT SCREW ZIRCONIA

Only with flat screw seat for monolithic zirconia and resin.
ZIRKONZAHN MULTI UNIT ABUTMENT NON HEX

Multi Unit Abutments NON HEX without anti-rotation connection as well as anti-rotation device on the platform, are especially suited for multi-unit restorations and are designed in one piece to prevent bacterial entrance. The application of the Multi Unit Abutments NON HEX is extremely easy, because all types of implants have been adapted on a standard connection. In order to offer the best possible solution for every case, they are also available in five different gingival heights.

For multi-unit restorations

Conical Titanium Base as component of the Multi Unit Abutment

Without anti-rotation connection as well as anti-rotation device on the platform

Also available gold-plated for increased biocompatibility and reduced grey values

Available in different gingival heights
Zirkonzahn Multi Unit Abutments 17° are available with an angle of 17° to compensate for any inclinations of the implants and with two different anti-rotation connection types which allow intermediate positions. They can be used for single crowns and multi-unit restorations.

For single crowns and multi-unit restorations

Conical Titanium Base, Parallel Titanium Base and Parallel Titanium Base One Position as components of the Multi Unit Abutment 17°. One Position titanium bases are used to screw single crowns on Multi Unit Abutments 17° with anti-rotation device

With anti-rotation connection as well as anti-rotation device on the platform

Also available gold-plated for increased biocompatibility and reduced grey values

Available in different gingival heights
The Zirkonzahn Multi Unit Abutments and Multi Unit Abutments 17° are especially suited for multi-unit restorations. They are available for all existing implant systems and their connections to the secondary structure are standardised: for this reason, the secondary structure can be screwed directly or with additional titanium bases to different implants without any problems. A further advantage of the standardised connection is that using these abutments, also other components (e.g. titanium bases, Scanmarkers, etc.) are reduced to one connection and divergences can be compensated.
Restoration fixed on two Multi Unit Abutments and two Multi Unit Abutments 17°, which allow to compensate the implants’ diverging axes.
FOR MULTI-UNIT RESTORATIONS

Type 2
ZIRKONZAHN LOC-CONNECTOR

Zirkonzahn LOC-Connector is a snap attachment for implants and bars that is used to fix removable dental prostheses on the implants. Zirkonzahn LOC-Connectors combine the advantages of removable and fixed prostheses and their snap-on mechanism allows both patients and dentists to insert and remove the restoration easily. They can be used for bridges only and on Zirkonzahn Multi Unit Abutments, Multi Unit Abutments 17° and metal bars.
Zirkonzahn LOC-Connectors on Zirkonzahn Multi Unit Abutments

Zirkonzahn LOC-Connectors on a titanium bar
Our Raw-Abutments® are made of a high-quality medical titanium alloy (Ti-6Al-4V ELI according to ASTM F136 and ISO 5832-3) and enable the manufacture of customised one-piece abutments thanks to their industrially prefabricated implant connections, which guarantee the highest precision and fitting accuracy. In addition, the individual design of the abutment geometry compensates for implant divergences, preventing the vestibular protrusion of the screw channel and ensuring highly aesthetic restorations. Special milling strategies and milling burs are then used to provide the Raw-Abutments® with a particularly smooth surface structure. Depending on the implant system, different Raw-Abutment® blanks are required.

For single crowns and multi-unit restorations (especially for cemented, non-removable restorations)

With anti-rotation connection

Available with a diameter of 10 mm and 14 mm;
Ø 14 mm optimal for molar region

Can be anodised in different colours with the Titanium spectral-colouring Anodizer
Using special Raw-Abutment® holders in Ø 95 mm or Ø 125 mm, it is possible to mill up to three or six Raw-Abutments® in just one process.
The Zirkonzahn Titanium Posts are root posts made of a medical titanium alloy. They are used to reconstruct teeth with extensive coronal defects. Using special attachments, the position and inclination of the posts can be determined for the next working steps in the design software.
Preparing the post canals

Insertion of the Titanium Posts with special attachments; digitisation

Shortening the titanium post; insertion of the crown, designed with a fixed post

Sealing the post canal in the crown
TITANIUM BASE EXTRACTOR

Abutments are fitted to laboratory analogues or implants directly on the model or in the patient’s mouth and then screwed. If the abutment is fixed on an implant with a flat-angled connection, a frictional connection is created. In the conventional manual way, the two components cannot be separated from each other without causing some damage. By using the Titanium Base Extractor this is possible without overstressing the osseointegrated parts.

The Titanium Base Extractor is screwed into the internal thread of the abutment...

...until the bottom is reached.

A further screwing...

...ensures a damage-free removal of the abutment from the implant or laboratory analogue.
The Titanium Base Extractor A15 is used to remove abutments from implants or laboratory analogues without overstressing the osseointegrated parts. Thanks to its unified right angled shank, it can be used in combination with the Adapter Ratchet Wrench or with the handpiece for screwdrivers. In situations with limited space, the Titanium Base Extractor A15 can also be individually shortened with the Adjusting Adapter Ratchet Wrench.

Insert the Titanium Base Extractor A15 into the Adapter Ratchet Wrench and remove the abutment from the implant.

Insert the Titanium Base Extractor A15 into the handpiece for screwdrivers and remove the abutment from the laboratory analogue.

The system library for our Titanium Base Extractors A15 is constantly expanded.
The Universal Extractor is used to remove directly screwed secondary structures (e.g. made of metal or resin) as well as titanium bases without internal threads from implants with flat-angle connection geometries.
SEALING SCREW EXTRACTOR

*With the Sealing Screw Extractor, sealing screws can be loosened from zirconia structures without damaging the threaded screw channel.*
SCREW EXTRACTOR RESCUE KIT

With the Screw Extractor Rescue Kit it is possible to remove from the implant a broken abutment screw. Using a left-rotating drill and a drill guide, which must be placed accurately on the implant, the screw can be removed without causing damage to the implant.
The drill guide is equipped with a “drill stop” which prevents the drill from damaging the implant. After the drilling process, the drill and its guide can be removed from the implant. If the screw is already loosened, it can be removed easily.

If the screw has not loosened from the implant yet, the Screw Extractor and the Adapter Ratchet Wrench are required. After screwing the Screw Extractor, it is possible to remove the screw.
UNIVERSAL SCREWDRIVER SET

Tool set to fix and loosen abutment screws. The set consists of the new Torque Ratchet Wrench, Adapter Ratchet Wrench and several screwdrivers, which are available for different implant systems and in different lengths.

Torque Ratchet Wrench

Adapter Ratchet Wrench

Depending on the system, the screwdriver is available in different lengths (short, medium, long, extra-long)
The screwdriver can be individually equipped: depending on the system, it is available in different lengths (short, medium, long, extra-long)

Torque Ratchet Wrench

Handpiece for screwdrivers

Screwdriver
Zirkonzahn MUA

Adapter Ratchet Wrench
SCREWDRIVER ZIRKONZAHN FOR MUA

The screwdrivers are used in combination with the Torque Ratchet Wrench to fix and loosen the Multi Unit Abutments NON HEX.
ADJUSTING ADAPTER RATCHET WRENCH

The Adjusting Adapter Ratchet Wrench is used for the alternative insertion of Zirkonzahn screwdrivers with right angled shank into the Torque Ratchet Wrench.

In situations with limited space, e.g. in the molar region, its special design allows the use of screwdrivers with reduced length. In order to determine the ideal length, it is necessary to insert the appropriate screwdriver into the Adjusting Adapter Ratchet Wrench and mark the desired length. The screwdriver can be then shortened, reinserted into the Adjusting Adapter Ratchet Wrench and fixed in place using three clamping screws.

The Adjusting Adapter Ratchet Wrench is suitable for use both in laboratory and in patient’s mouth.
The production of full-arch prosthetics on divergent implants is one of the most challenging jobs.

With the new Double Screw Metal function of the Zirkonzahn.Modellier software (CAD/CAM Attachment software module), additional screws can be integrated to screw the secondary structure to the titanium bar. Thanks to this new function, it is possible to visualise the screw virtual positions and generate virtual screw threads within the bar design. The 3D rendering also provides the optimal position of the screw channel in the primary structure, as well as the ideal fit of the screw head in the superstructure. The screw channels generated in the software are integrated in the bar during milling. The titanium bar is then screwed to the implants and the secondary structure to the bar.

With the Double Screw Metal technique it is now possible to avoid unaesthetic vestibular channels, in order to produce highly stable, bar-supported rehabilitations even in complex cases without compromising the full arch aesthetics.

When developing our Zirkonzahn.Software we adapted the strict standards of our proven products to its design and functionality. The well-structured and simply designed user interface characterises each software component, making it the cornerstone for a familiar and reliable application. When it comes to the creation of different features, our developing team, which obviously includes also dental technicians, follows a practical and result-oriented principle, which guarantees the greatest possible freedom of choice and processing. Furthermore, complex technological processes are designed in a comprehensive and transparent way. The user can decide whether he wants to use a step by step guide or if he wants to proceed individually. The different software programs with the corresponding modules are matched not only to each other, but also to the related hardware components. This ensures a 100% smooth workflow between dental technicians and dentists – from patient registration and articulation, to the design, production and insertion of the final restoration in the patient’s mouth. Proven manual and digital working techniques can be combined in order to achieve the best possible patient-oriented restoration.
ZIRKONZAHN LIBRARY DOWNLOAD CENTER

- Zirkonzahn implant components for exocad® and 3Shape users
- Free program for importing and using all Zirkonzahn implant components in 3Shape or exocad® design software
- Fast download: implant libraries can be individually downloaded
- Always up to date: automatic update information for newly available systems or system components

ZIRKONZAHN.TRAY SOFTWARE

- Step-by-step guided, open software for the production of individual impression trays
- Open STL data format – compatible with different production processes (e.g. 3D printing) and systems
- Possibility of individual design (edges, dimensions, retentions and holes)
- Adjustable tool sizes for a quick design

HEROES COLLECTION VIRTUAL TOOTH LIBRARY

- Virtual tooth library with ten natural and aesthetic tooth sets (for upper and lower jaw)
- For the design of all types of restoration; also for the creation of set-ups with rooted teeth. For subsequent use in the implant planning phase
- Fully anatomical or in four virtual cut-back designs (FIRE, WATER, AIR, EARTH) for veneering with ceramics
With the Zirkonzahn.Implant-Planner, the cooperation between the dentist and the dental laboratory can be brought to new levels, reconciling the planned aesthetic design of a prosthetic restoration with the planned implant situation.

- 3D implant planning software approved as medical device
- Intuitive software with step-by-step guide (Wizard)
- Compatible with all open DICOM data from CT-, CBCT-, DCM-devices
- Determination of the ideal implant position on the basis of bone density and patient individual data such as DICOM data, wax-up, intraoral and model scans as well as 3D facial scans. Manual adjustments are possible
- Conversion of DICOM data into STL data records for further processing with other CAD software (CAD/CAM STL- software module required)
- Wide implant libraries with different implant-prosthetic components compatible with all common implant systems; library with a wide range of drilling sleeves. The libraries are being constantly expanded.
- Export of the planned implant case for further processing by other software (ideally Zirkonzahn.Modellier) and for planning prosthetic restorations or models with laboratory analogues. Manufacturing with Zirkonzahn CAD/CAM milling units, CAD/CAM systems by other manufacturers or 3D printers
- Creation of surgical guides, which can be either tooth-borne, bone-borne or mucosa-borne and be fixed with pins
- Creation of customised impression trays (CAD/CAM Z-Tray software module required)
ZIRKONZAHN.IMPLANT-PLANNER

Full version for the laboratory, with relevant tools for implant planning and for the production of surgical guides

ZIRKONZAHN.IMPLANT-PLANNER PRACTICE

Software version for the dental practice, with all relevant functions for implant planning only

ADDITIONAL ZIRKONZAHN.IMPLANT-PLANNER SOFTWARE MODULES (OPTIONAL)*

- CAD/CAM STL-Converter software module – Module for converting DICOM data into STL data for further processing with different CAD software
- CAD/CAM Z-Tray software module – Module for the production of individual impression trays

*at extra charge
CAD/CAM MODEL MAKER SOFTWARE MODULE

- Module for the production of different physical models (e.g. Geller models, models with implant analogues, dies, full-arch bridges) based on intraoral scan data as well as impression and model scans
- Customised parameters setting: e.g. distance between model and die, model thickness
- Automatic margin and undercut identification
- Exportable data for producing models with 3D printers
- Creation of positioning pins for transferring the digitally recorded occlusion into the laboratory articulator
- In combination with the Zirkonzahn Implant-Planner: service package for dentists, consisting of implant model, impression tray, surgical guide and temporary restoration
CAD/CAM ABUTMENTS SOFTWARE MODULE

- Module for the production of individual abutments and their emergence profile
- Abutments design by taking into account the secondary structure; adjustable crown bottom parameters
- Semi-transparent display of the outer tooth form for a much easier virtual abutments creation
- Compatible with all common implant systems, to be directly screwed in or by means of bonded titanium bases
- Adjustment of the implant position by virtual rotation
  (titanium bases K80 Angled Screw Channel – ASC)

Attention – it only works in combination with the CAD/CAM Occlusally Screwed Bridges software module

CAD/CAM OCCLUSALLY SCREWED BRIDGES SOFTWARE MODULE

- Module for the creation of occlusally screwed bridges and bars
- Free shaping of the emergence profile, taking into account the anatomic tooth shape and gingiva
- Using the scanbodies, the software calculates the alignment of the implants and uses it for the exact alignment of the screw channels
- Creation of threaded screw channels in the zirconia structure for sealing the restoration with sealing screws (made from the Screw Blank) in the patient’s mouth. The restoration can be easily removed by unscrewing the screws with the extractor
- Adjustment of the implant position by virtual rotation
  (titanium bases K80 Angled Screw Channel – ASC)
CAD/CAM BARS SOFTWARE MODULE

- Module for the individual production of primary and hybrid bars (also implant-supported)
- Freely customisable emergence profile
- Semi-transparent display of the outer tooth form or separate situation scans for a much easier virtual bars creation
- The different available bar profiles can be easily modified
- Customised parameters setting: height, thickness, lingual and buccal angle, as well as many other individualisation options
- Possibility of fixing attachments, retentions, holes as well as anchorings
- Adjustment of the implant position by virtual rotation (titanium bases K80 Angled Screw Channel – ASC)
- Possibility of screwing the superstructure through special threaded screw channels milled in the bar.

In combination with the CAD/CAM Attachment software module
  - Double Screw Bar
  - Zirkonzahn LOC-Connector
CAD/CAM VIRTUAL ARTICULATOR SOFTWARE MODULE

- Module for jaw movement simulation in the articulator
- Registration of the physical articulator via the Zirkonzahn scanner
- All current articulators are digitally stored
- All movements are recreated virtually
- Dynamic adaptation of constructed contact points with the antagonist taking into account chewing movements
- Possibility of importing and using patient-specific jaw movement data (PlaneAnalyser) via an additional module
DIGITAL WORKFLOW FOR EDENTULOUS CASES

Our software supports all common implant systems and the bars design is realised in relation to the secondary structure. From single crowns to 14-unit occlusally screw-retained bridges, everything can be produced with Zirkonzahn CAD/CAM system in one’s own laboratory. An example of workflow for the treatment of edentulous cases is shown below.

Case made by Dr. Francesco Mintrone, Sassuolo, Italy and MDT Antonio Corradini, Zirkonzahn Education Center Brunico, Italy

Creation of the patient case in the Zirkonzahn.Archiv software: collection and importing of all kind of data (intraoral as well as facial scans) into the software.

Digital acquisition of the gingiva: the scan is transferred into the Zirkonzahn.Scan software and matched with all other patient data available. As an alternative to the intraoral scanner, conventional acquisition methods with models and impressions can be used.
Digital acquisition of the patient’s Natural Head Position and reference planes based on the PlaneSystem® (MDT, Udo Plaster): the patient’s acquired data are transferred 1:1 into the Zirkonzahn.Scan software in correct position and matched with the 3D facial scans for the virtual articulation.

Based on the digitally recorded patient data, tooth set-ups are designed in the Zirkonzahn.Modifier software for a first evaluation of aesthetics and function. The tooth anatomies are selected from the Heroes Collection virtual tooth library.

During the implant planning phase, the dentist can choose the implant systems, pins and drilling sleeves from the wide software libraries.
The correct implant positions are imported in the CAD software with virtual scanmarkers and the models are designed with ScanAnalogs in the CAD/CAM Model Maker software module.

In the Zirkonzahn.Implant-Planner software, the implants positions are set by the dentist or proposed by the dental technician, taking into account bone density, function and aesthetics.

Only after the dentist’s approval concerning the implants positions and inclinations, the dental technician can design and mill (or print with the 3D printer) the surgical guides.

The correct implant positions are imported in the CAD software with virtual scanmarkers and the models are designed with ScanAnalogs in the CAD/CAM Model Maker software module.
In order to reproduce the implant positions, the physical models equipped with ScanAnalogs can be milled or printed. The ScanAnalogs and the models are then used to check the fit of the surgical guides, the prototypes and the final restoration.

In the Zirkonzahn Modellier software, the dental technician selects the same system and components used during the implant planning phase.

Once the resin prototypes for immediate loading are designed and milled ...
... the patient wears the prototypes until the implants have fully integrated into the bone.

After the healing phase, the new situation is recorded by scanning the prototypes with ScanAnalogs and by acquiring the gingiva impression. After matching these scan data, the temporaries for the final restorations are created. Alternatively, it is possible to use the intraoral scanner with White Scanmarkers.

Once the temporaries have been tried on by the patient, they are scanned. Wax-ups are then created to design the final zirconia restorations and the bar is designed, milled and then anodised with the Titanium spectral-colouring Anodizer.
The final restorations in Prettau® 2 zirconia, with anodised titanium bar and bases, are then realised. The maxillary restoration is provided with threaded screw channels.

To seal the Prettau® Bridges screw channels, special resin screws are milled and applied directly in the patient’s mouth.

The final Prettau® Bridges in-situ.
